

DEEP ROOTS & DROUGHT TOLERANT WITH LESS MAINTENANCE

Xeriscape 80/20 Fescue and Bluegrass Blend solves the Tall Fescue issue of uneven surfaces and clumping.

- **Eco-Friendly & Drought Tolerant**
- **Finer Blades than other Fescues**
- **Great in Full Sun & Partial Shade**
- **Cold & Heat Tolerant - *Perfect for Colorado Weather***
- **Durable Surface for High Traffic & Relaxation**
- **Drought Tolerant & Pest Resistant**

Tall Fescue is widely known for its capacity to grow deep roots, thus making it a long-term low water usage turf. Bluegrass is an improved solution for less maintenance.

***Recommended for:* Athletic Fields, Front & Back Yards, Golf Courses, Parks and other Landscape projects where high traffic use, superior durability, density and safety are necessary. Great for Xeriscape projects!**

XERISCAPE 80/20

Fescue & Bluegrass Blend

Blend Varieties and Characteristics:

Black Beauty: Jonathan Green's Black Beauty has a dark-green color, grows roots up to 4' deep, possesses a waxy coating on the leaf to preserve moisture when hot, and is grown by leading sod growers across the U.S.A. Its superior varieties will improve even the poorest of lawns. Black Beauty is a finer bladed sod, fescue giving it a wonderful appearance with all the benefits of a turf-type tall fescue. Black Beauty is more drought-tolerant and durable than other types of grass. It is also very wear-tolerant and lush, performing well in even high traffic areas and in poor soils of low pH, where other seeding jobs often fail. Black Beauty Sod is naturally pest repellent and requires less water and fewer nutrients to thrive – making this blend an environmentally sound choice that lowers your environmental footprint

Tomahawk: Selected specifically for glyphosate tolerance to reduce weeds and lower maintenance costs. An adaptable turf, Tomahawk is suitable for Colorado's drier climate and lower humidity. It performs well in a wide range of soil types, tolerates full sun to moderate shade and in comparison to other cool season turfs, it has excellent drought and heat tolerance. Tomahawk is deeply rooted and when established and maintained correctly, will reduce your water usage over time. Wear resistance is good, it has a uniform medium density and a bunch-type growth habit. Tomahawk is a medium to dark green color and has a finer narrow leaf blade. Mowing heights are suggested from 1-1/2" to 3" and is height-consistent with blend varieties listed below for easy maintenance.

Matador: One of the best cool season grasses available, Matador is an outstanding tall fescue variety that excels in all major turfgrass characteristics. This variety of turf still maintains its deeply rooted characteristic for water savings and lower growth rate to lower maintenance costs. In addition to complimenting all the finest qualities of the above two varieties, certain characteristics of Matador have been vastly improved: Turf quality, brown patch resistance, glyphosate tolerance, adaptability to all climates except the most extreme areas of the southeast, and performance even during the cool wet winters of the Pacific Northwest. Mowing height is suggested at 1" to 2-1/2," meaning Matador blends beautifully with the above listed varieties. Turf managers will have vastly improved control of grassy weeds in tall fescue turf and all will appreciate saving time, money and water.

Hampton Kentucky Bluegrass - Nicknamed "The Root Monster" due to its standout deep and fibrous root production for improved drought tolerance. Hampton is a favorite of elite turfgrass sod producers and rated near the top in shear strength across multiple blends, mixtures and species at Cornell University. It also adds terrific winter color, excellent spring green up and seedling vigor, drought tolerance and traffic performance with the highest rated horizontal shoot leaf growth habit.
